### C06GSF - NAG Fortran Library Routine Document

Note. Before using this routine, please read the Users' Note for your implementation to check the interpretation of bold italicised terms and other implementation-dependent details.

## 1 Purpose

C06GSF takes m Hermitian sequences, each containing n data values, and forms the real and imaginary parts of the m corresponding complex sequences.

## 2 Specification

SUBROUTINE COGGSF(M, N, X, U, V, IFAIL)

INTEGER M, N, IFAIL

real X(M\*N), U(M\*N), V(M\*N)

# 3 Description

This is a utility routine for use in conjunction with C06FPF and C06FQF (see the Chapter Introduction).

#### 4 References

None.

#### 5 Parameters

1: M — INTEGER

On entry: the number of Hermitian sequences, m, to be converted into complex form.

Constraint:  $M \ge 1$ .

2: N — INTEGER Input

On entry: the number of data values, n, in each sequence.

Constraint:  $N \ge 1$ .

3: X(M\*N) - real array

On entry: the data must be stored in X as if in a two-dimensional array of dimension (1:M,0:N-1); each of the m sequences is stored in a **row** of the array in Hermitian form. If the n data values  $z_j^p$  are written as  $x_j^p + iy_j^p$ , then for  $0 \le j \le n/2$ ,  $x_j^p$  is contained in X(p, j), and for  $1 \le j \le (n-1)/2$ ,  $y_j^p$  is contained in X(p, n-j). (See also Section 2.1.2 of the Chapter Introduction.)

4: U(M\*N) — real array

5: V(M\*N) — real array

Output

On exit: the real and imaginary parts of the m sequences of length n, are stored in U and V respectively, as if in two-dimensional arrays of dimension (1:M,0:N-1); each of the m sequences is stored as if in a **row** of each array. In other words, if the real parts of the pth sequence are denoted

by  $x_i^p$ , for  $j=0,1,\ldots,n-1$  then the mn elements of the array U contain the values

$$x_0^1, x_0^2, \dots, x_0^m, x_1^1, x_1^2, \dots, x_1^m, \dots, x_{n-1}^1, x_{n-1}^2, \dots, x_{n-1}^m$$

**6:** IFAIL — INTEGER Input/Output

On entry: IFAIL must be set to 0, -1 or 1. For users not familiar with this parameter (described in Chapter P01) the recommended value is 0.

On exit: IFAIL = 0 unless the routine detects an error (see Section 6).

[NP3390/19/pdf] C06GSF.1

## 6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors detected by the routine:

```
\begin{split} \text{IFAIL} &= 1 \\ &\quad \text{On entry}, \ \ M < 1. \\ \\ \text{IFAIL} &= 2 \\ &\quad \text{On entry}, \ \ N < 1. \end{split}
```

# 7 Accuracy

Exact.

#### 8 Further Comments

None.

# 9 Example

This program reads in sequences of real data values which are assumed to be Hermitian sequences of complex data stored in Hermitian form. The sequences are then expanded into full complex form using C06GSF and printed.

#### 9.1 Program Text

**Note.** The listing of the example program presented below uses bold italicised terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
