NAG Fortran Library Routine Document G05DAF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of **bold italicised** terms and other implementation-dependent details.

1 Purpose

G05DAF returns a pseudo-random real number taken from a uniform distribution over the interval [a, b].

2 Specification

3 Description

This distribution has PDF (probability density function)

$$f(x) = \frac{1}{|a-b|}$$
 if $x \in [a,b]$,

$$f(x) = 0$$
 otherwise.

The routine returns the value

$$x = a + (b - a)y$$

where y is a pseudo-random number from a uniform distribution over (0,1), generated by G05CAF. The routine ensures that x lies in the closed interval [a,b].

G05FAF may be used to generate a vector of n pseudo-random numbers which, if computed sequentially, are exactly the same as n successive values of G05DAF. On many machines G05FAF is likely to be much faster.

4 References

5 Parameters

1: A - real
2: B - real
Input
Input

On entry: the end-points a and b of the distribution. It is not necessary that a < b.

6 Error Indicators and Warnings

None.

7 Accuracy

Not applicable.

8 Further Comments

None.

[NP3546/20] G05DAF.1

9 Example

The example program prints the first five pseudo-random real numbers from a uniform distribution between 1.0 and 1.5, generated by G05DAF after initialisation by G05CBF.

The generator mechanism used is selected by an initial call to G05ZAF.

9.1 Program Text

Note: the listing of the example program presented below uses *bold italicised* terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
