NAG Fortran Library Routine Document

G13FAF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

1 Purpose

G13FAF estimates the parameters of either a standard univariate regression GARCH process, or a univariate regression-type I AGARCH(p, q) process (see Engle and Ng (1993)).

2 Specification

```
 SUBROUTINE G13FAF(DIST, YT, X, LDX, NUM, IP, IQ, NREG, MN, ISYM, NPAR,

```

3 Description

A univariate regression-type I AGARCH(p, q) process, with q coefficients α_i, for $i = 1, \ldots, q$, p coefficients β_i, for $i = 1, \ldots, p$, and k linear regression coefficients b_i, for $i = 1, \ldots, k$, can be represented by:

$$y_t = b_o + {x_t}^T b + \epsilon_t \tag{1}$$

$$h_t = \alpha_0 + \sum_{i=1}^{q} \alpha_i (\epsilon_{t-i} + \gamma)^2 + \sum_{i=1}^{p} \beta_i h_{t-i}, \quad t = 1, \ldots, T \tag{2}$$

where $\epsilon_t | \psi_{t-1} = N(0, h_t)$ or $\epsilon_t | \psi_{t-1} = S_t(df, h_t)$. Here S_t is a standardised Student's t-distribution with df degrees of freedom and variance h_t, T is the number of terms in the sequence, y_t denotes the endogenous variables, x_t the exogenous variables, b_o the regression mean, b the regression coefficients, ϵ_t the residuals, h_t is the conditional variance, df the number of degrees of freedom of the Student's t-distribution, and ψ_t the set of all information up to time t.

G13FAF provides an estimate for $\hat{\theta}$, the parameter vector $\theta = (b_o, b^T, \omega^T)$ where $b^T = (b_1, \ldots, b_k)$, $\omega^T = (\alpha_0, \alpha_1, \ldots, \alpha_q, \beta_1, \ldots, \beta_p, \gamma)$ when DIST = 'N' and $\omega^T = (\alpha_0, \alpha_1, \ldots, \alpha_q, \beta_1, \ldots, \beta_p, \gamma, df)$ when DIST = 'T'.

ISYM, MN and NREG can be used to simplify the GARCH(p, q) expression in (1) as follows:

No Regression and No Mean

$y_t = \epsilon_t$,

ISYM = 0,

MN = 0,

NREG = 0 and

θ is a $(p + q + 1)$ vector, when DIST = 'N' and a $(p + q + 2)$ vector, when DIST = 'T'.

No Regression

$y_t = b_o + \epsilon_t,$

ISYM = 0,

MN = 1,

NREG = 0 and

θ is a $(p+q+2)$ vector when DIST = 'N' and a $(p+q+3)$ vector, when DIST = 'T'.

Note: if the $y_t = \mu + \epsilon_t$, where μ is known (not to be estimated by G13FAF) then (1) can be written as ${y_t}^\mu = \epsilon_t$, where ${y_t}^\mu = y_t - \mu$. This corresponds to the case **No Regression and No Mean**, with y_t replaced by $y_t - \mu$.

No Mean

$y_t = {x_t}^T b + \epsilon_t,$

ISYM = 0,

MN = 0,

NREG = k and

θ is a $(p+q+k+1)$ vector when DIST = 'N' and a $(p+q+k+2)$ vector, when DIST = 'T'.

5 Parameters

1: DIST – CHARACTER*1 *Input*

On entry: the type of distribution to use for e_t.

If DIST = 'N', a Normal distribution is used.

If DIST = 'T', a Student's t-distribution is used.

Constraint: DIST = 'N' or 'T'.

2: YT(NUM) – ***real*** array *Input*

On entry: the sequence of observations, y_t, for $t = 1, \ldots, T$.

3: X(LDX,*) – ***real*** array *Input*

Note: the second dimension of the array X must be at least $\max(1, \text{NREG} + \text{MN})$.

On entry: row t of X must contain the time dependent exogenous vector x_t, where ${x_t}^T = ({x_t}^1, \ldots, {x_t}^k)$, for $t = 1, \ldots, T$.

4: LDX – INTEGER *Input*

On entry: the first dimension of the array X as declared in the (sub)program from which G13FAF is called.

Constraint: LDX $\geq$ NUM.

5: NUM – INTEGER *Input*

On entry: the number of terms in the sequence, T.

Constraint: NUM $\geq \max(\text{IP}, \text{IQ})$.

6: IP – INTEGER *Input*

On entry: the number of coefficients, β_i, for $i = 1, \ldots, p$.

Constraint: IP ≥ 0 (see also NPAR).

7: IQ – INTEGER *Input*

On entry: the number of coefficients, α_i, for $i = 1, \ldots, q$.

Constraint: IQ ≥ 1 (see also NPAR).

8: NREG – INTEGER *Input*

On entry: the number of regression coefficients, k.

Constraint: NREG ≥ 0 (see also NPAR).

9: MN – INTEGER *Input*

On entry: if MN $= 1$, the mean term b_0 will be included in the model.

Constraint: MN $= 0$ or 1.

10: ISYM – INTEGER *Input*

On entry: if ISYM $= 1$ then the asymmetry term γ will be included in the model.

Constraint: ISYM $= 0$ or 1.

11: NPAR – INTEGER *Input*

On entry: the number of parameters to be included in the model. NPAR $= 1 + \text{IQ} + \text{IP} + \text{ISYM} + \text{MN} + \text{NREG}$ when DIST = 'N', and NPAR $= 2 + \text{IQ} + \text{IP} + \text{ISYM} + \text{MN} + \text{NREG}$ when DIST = 'T'.

Constraint: NPAR < 20.

12: THETA(NPAR) – ***real*** array *Input/Output*

On entry: the initial parameter estimates for the vector θ. The first element must contain the coefficient α_o and the next IQ elements must contain the coefficients α_i, for $i = 1, \ldots, q$. The next IP elements must contain the coefficients β_j, for $j = 1, \ldots, p$. If ISYM $= 1$, then the next element must contain the asymmetry parameter γ. If DIST = 'T', then the next element must contain df, the number of degrees of freedom of the Student's t-distribution. If MN $= 1$, then the next element must contain the mean term b_o. If COPTS(2) = .FALSE., then the remaining NREG elements are taken as initial estimates of the linear regression coefficients b_i, for $i = 1, \ldots, k$.

On exit: the estimated values $\hat{\theta}$ for the vector θ. The first element contains the coefficient α_o, the next IQ elements contain the coefficients α_i, for $i = 1, \ldots, q$. The next IP elements are the coefficients β_j, for $j = 1, \ldots, p$. If ISYM $= 1$ then the next element contains the estimate for the asymmetry parameter γ. If DIST = 'T' then the next element contains an estimate for df, the number of degrees of freedom of the Student's t-distribution. If MN $= 1$ then the next element contains an estimate for the mean term b_o. The final NREG elements are the estimated linear regression coefficients b_i, for $i = 1, \ldots, k$.

13: SE(NPAR) – ***real*** array *Output*

On exit: the standard errors for $\hat{\theta}$. The first element contains the standard error for α_o. The next IQ elements contain the standard errors for α_i, for $i = 1, \ldots, q$. The next IP elements are the standard errors for β_j, for $j = 1, \ldots, p$. If ISYM $= 1$, then the next element contains the standard error for γ.

If DIST = 'T', then the next element contains the standard error for df, the number of degrees of freedom of the Student's t-distribution. If MN = 1, then the next element contains the standard error for b_o. The final NREG elements are the standard errors for b_j, for $j = 1, \ldots, k$.

14: SC(NPAR) – ***real*** array *Output*

On exit: the scores for $\hat{\theta}$. The first element contains the score for α_o. The next IQ elements contain the score for α_i, for $i = 1, \ldots, q$. The next IP elements are the scores for β_j, for $j = 1, \ldots, p$. If ISYM = 1, then the next element contains the score for γ. If DIST = 'T' then the next element contains the score for df, the number of degrees of freedom of the Student's t-distribution. If MN = 1, then the next element contains the score for b_o. The final NREG elements are the scores for b_j, for $j = 1, \ldots, k$.

15: COVAR(LDC,NPAR) – ***real*** array *Output*

On exit: the covariance matrix of the parameter estimates $\hat{\theta}$, that is the inverse of the Fisher Information Matrix.

16: LDC – INTEGER *Input*

On entry: the first dimension of the array COVAR as declared in the (sub)program from which G13FAF is called.

Constraint: LDC $\geq$ NPAR.

17: HP – ***real*** *Input/Output*

On entry: if COPTS(2) = .FALSE., then HP is the value to be used for the pre-observed conditional variance; otherwise HP is not referenced.

On exit: if COPTS(2) = .TRUE., then HP is the estimated value of the pre-observed of the conditional variance.

18: ET(NUM) – ***real*** array *Output*

On exit: the estimated residuals, ϵ_t, for $t = 1, \ldots, T$.

19: HT(NUM) – ***real*** array *Output*

On exit: the estimated conditional variances, h_t, for $t = 1, \ldots, T$.

20: LGF – ***real*** *Output*

On exit: the value of the log likelihood function at $\hat{\theta}$.

21: COPTS(2) – LOGICAL array *Input*

On entry: the options to be used by G13FAF.

If COPTS(1) = .TRUE., stationary conditions are enforced, otherwise they are not.

If COPTS(2) = .TRUE., the routine provides initial parameter estimates of the regression terms, otherwise these are provided by the user.

22: MAXIT – INTEGER *Input*

On entry: the maximum number of iterations to be used by the optimization routine when estimating the GARCH(p, q) parameters. If MAXIT is set to 0 then the standard errors, score vector and variance-covariance are calculated for the input value of θ in THETA; however the value of θ is not updated.

Constraint: MAXIT $\geq$ 0.

23: TOL – ***real*** *Input*

On entry: the tolerance to be used by the optimization routine when estimating the GARCH(p, q) parameters.

24: WORK(LWORK) – ***real*** array *Workspace*
25: LWORK – INTEGER *Input*

On entry: the dimension of the array WORK as declared in the (sub)program from which G13FAF is called.

Constraint: LWORK $\geq$ (NREG + 3) $\times$ NUM + NPAR + 403.

26: IFAIL – INTEGER *Input/Output*

On entry: IFAIL must be set to 0, -1 or 1. Users who are unfamiliar with this parameter should refer to Chapter P01 for details.

On exit: IFAIL = 0 unless the routine detects an error (see Section 6).

For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, because for this routine the values of the output parameters may be useful even if IFAIL $\neq$ 0 on exit, the recommended value is -1. **When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.**

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

On entry, NREG < 0,
or MN > 1,
or MN < 0,
or ISYM > 1,
or ISYM < 0,
or IQ < 1,
or IP < 0,
or NPAR $\geq$ 20,
or NPAR has an invalid value,
or LDC < NPAR,
or LDX < NUM,
or DIST $\neq$ 'N',
or DIST $\neq$ 'T',
or MAXIT < 0,
or NUM < max(IP, IQ).

IFAIL = 2

On entry, LWORK < (NREG + 3) $\times$ NUM + NPAR + 403.

IFAIL = 3

The matrix X is not full rank.

IFAIL = 4

The information matrix is not positive definite.

IFAIL = 5

The maximum number of iterations has been reached.

IFAIL = 6

The log-likelihood cannot be optimised any further.

IFAIL = 7

No feasible model parameters could be found.

7 Accuracy

Not applicable.

8 Further Comments

None.

9 Example

This example program uses G05HKF to generate 1500 data points, with known process parameters θ for the following two time-series:

(i) An ARCH(3) sequence with normally distributed residuals.

(ii) A GARCH(1,2) sequence with Student's t-distributed residuals.

Here G05HKF is initially called, with the output discarded, to eliminate 'start-up effects' in these sequences. The process parameter estimates, $\hat{\theta}$, are then obtained using G13FAF, and compared with their true values, θ. Finally a four step ahead volatility estimate is computed using G13FBF.

9.1 Program Text

Note: the listing of the example program presented below uses ***bold italicised*** terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
